Reflection

In this week I've learned so much specially about on putting image and video on the browser. I've learned that I can personalized it and change it on my preferred size. On the footer that I can also change it to my name and make personalized so that my name is shown and the year I've created it. The main challenge I've encountered is about the name or naming the image file that what you name on the folder of the and video should be the name you also put on and type of image it is or the video. I've solved it by analyzing what is the problem and understanding what is being instructed I also solved it by playing again the demo. The improvement I've made is that I can change the size or font of the word I thought that what is on the code should always be like that my improvement is that I can personalize it on what I preferred.
