Reflection

I've learned in this week about making the map, weather, user preference, github api. , and the local storage this four was made in different file and I need to make it into one index.html, I've learned to make a website that the API is included how to make it interactive and to design it. I got to learned how design it where to put them and to style it. Challenges I've face many challenges in this week about the weather.api it doesn't work sometimes and doesn't get the exact weather. About the github that when you put the wrong username or misspelled it can't get the account. When making it into one index is about the flow of it and where will I put them and organize it. I've solved it by removing the code and pasting it again and follow the instruction from the demo, and about the github I put the exact username I use on my Github account. On the flow of it I've tried to visualize how I want it to be, when it comed to the code I ask a help on chatgpt on the structure and get some parts on the bootstrap. My improvements I finally know how to make the flow and structure of a web page and to design it, my improvement was all about how to make the web page interactive.
