Reflection

In this week I've learned that JAVASCRIPT make the web page interactive java allows or accept the action of the user, to make users request. I've also learned that we can switch theme I didn't know about this that's why I consider it as a learnings to me. The challenges I've encountered is about on running it that the java is on the surface, it doesn't run when I run it. Second about the switching theme I didn't know what was the problem why when I switch the theme it doesn't change. I've solved it when I try to click the index.html and I figure it out that It wont run if the java is on the surface and the j.son will appear. On switching is the .dark mode was not on the CSS. Improvement I've made is about on running the index.html when the java was on the surface I know now that once the java is on the surface the j.son will appear and won't run.
