Reflection

In this week I've learned the basic HTML5 document structure the `< !DOCTYPE html>` tells the browser that the web page is HTML5. I've learned also that `< !DOCTYPE html>` should be put in the first line. The challenges I've encountered are that if you didn't save the changes first it won't reflect on the browser once you refresh it as I first look at the vs code I found it difficult for me to navigate. Making a folder at first I don't know that the folder and the file are different I thought it's the same the function of it or purpose is the same. I've solved it by following the guide and as I use it everyday I get to familiarize the function, the steps I will do for the other laboratory. One improvement I've made is get to familiarize or recognize each icon.
