Reflection

In this week I've learned about the CSS (CASCADING STYLING SHEETS) that css control the visual structure of a web page It's like the paint or color that give the user the look the color the structure. Challenges I've encountered are the missing <main> because I didn't see that I didn't include it in copying so basically the structure is the problem I've encountered. Even in CSS I've forgot some part of the code that's why when I run it has some mistakes or error. I've solved it by checking it again the laboratory guide and making sure I include everything from the laboratory guide and fixing the parts checking if there are missing parts. One improvement is about the CSS that I can put the preferred design style or size of it style make it more presentable and the positioning of each part.
